## Smart Bike Parking Stations

by **bikeep**

Bikeep's smart bike parking stations provide the most advanced, high-security network of parking for private bikes. The stations can be operated via smartphone app or swipe card and boast multiple layers of security to keep bikes safe. Charging docks contain a self-locking compartment with an outlet to securely charge an e-bike.

## Powerful apps for end-users and admins

**Bikeep's mobile app** enables users to interact with the parking network throughout the city. End-users can **plan their commutes** ahead of time, access the parking stations at their destination and **get fast support** if needed.

**Bikeep's Console** gathers real-time and **statistical information** about locations, parking usage, and cyclists. It allows system operators to **remotely manage access**, including lock/unlock, payment options, and surveillance.

## Multi-Layer security

Bikeep offers the highest level of security for bikes. The steel locking arm **secures the front wheel and frame** of the bike, and any attempts to cut through the rack will trigger an **audible alarm**. The station also provides automatic **distress signal forwarding** and a **live usage overview**. An optional security camera add on can provide images of each station through the Bikeep Console.

## Optional charging for e-bikes

Bikeep stations are ready to **fuel the e-bike revolution** with the addition of a lockable compartment to protect bike chargers and to safely top up batteries with an internal GFI outlet.

110VAC power to the location should be handled by a qualified electrician in accordance with local standards and regulations.
